

Given a string s , return the number of palindromic substrings in it.

A string is a **palindrome** when it reads the same backward as forward.

A **substring** is a contiguous sequence of characters within the string.

Example 1:

Input: $s = "abc"$
Output: 3
Explanation: Three palindromic strings: "a", "b", "c".

Example 2:

Input: $s = "aaa"$
Output: 6
Explanation: Six palindromic strings: "a", "a", "a", "aa", "aa", "aaa".

String $s = "abc"$

Pal $\Rightarrow$ reverse of string
is equal to
string

Substring $\Rightarrow$ a, b, c, ab, bc, ~~ac~~, abc. $\rightarrow 3 \Rightarrow$ Ans.

Recursion $\Rightarrow$ choices + decisions. $\{a\} \begin{cases} \text{palindrome?} \end{cases}$

0 1 2 3 4
n i t i n

```
for (int i = 0; i < s.len; i++) {
    for (int j = i + 1; j <= s.len; j++) {
        SOP(i + " " + j);
    }
}
```

Axis orbit approach

axis-orbit } orbit = 1
axis+orbit }

n i t i n $t \Rightarrow$ Pal.

1. Count all pal. sub

2. Find longest pal. sub

3. Count all odd-length pal. sub

4. 1, even ')

5. Find longest odd-length pal. sub

6. 1, even ')

odd $\Rightarrow$ a, aba, ababa $\Rightarrow$ Pal.

Even $\Rightarrow$ aa, baab, cbaab $\Rightarrow$ Pal.

odd length pal. sub.
